Go Modules

- Modules are supported starting with Go v1.11 but the implementation was finalized in Go v1.13.
- **But what is in fact a module?**
  - A module is a collection of related Go packages stored in a directory tree with a go.mod file at its root.
- **A module contains one or more packages like a package contains one or more .go files.**
- A file called **go.mod** defines the module's path, which is also the import path, and its dependency requirements.
- The **go** command has direct support to work with modules, including recording and resolving dependencies on other modules.
