Label Statements

- Labels are used in break, continue, and goto statements.
- It is illegal to define a label that is never used.
- In contrast to other identifiers, labels are not block scoped and do not conflict with identifiers that are not labels. **They live in another space.**
- The scope of a label is the body of the function in which it is declared and excludes the body of any nested function.
- Most of the time labels are used to **terminate outer enclosing loops**.
